A best/next practice observatory

shelter

SCAN ME

The purpose of the best/next practice observatory is to provide an effective codification of knowledge for the whole Consortium. The results of this process are:

- a project ontology
- a review of the international regulatory framework
- a good practice observatory based on existing best practices
- identification and analysis of tools on adaptive governance for cultural heritage management
- a collection of historical events of the case studies.

How

The definition of a SHELTER ontology was identified by reviewing the existing literature. The other four elements (i.e. regulatory framework, good practices, tools, historical events) were framed through data gathering templates, specifically structured to facilitate the collection of existing knowledge.

Tool|Results

- the heterogeneous knowledge gathered through the literature review process and critical analysis of European Union (EU)-funded initiatives

- the protocols and data collection forms that were established to collect and describe the information

- the experimentation of a mock up for the definition of cultural heritage attributes, to be considered as a promising next practice.

Shelter Wiki icons as universal language for concepts
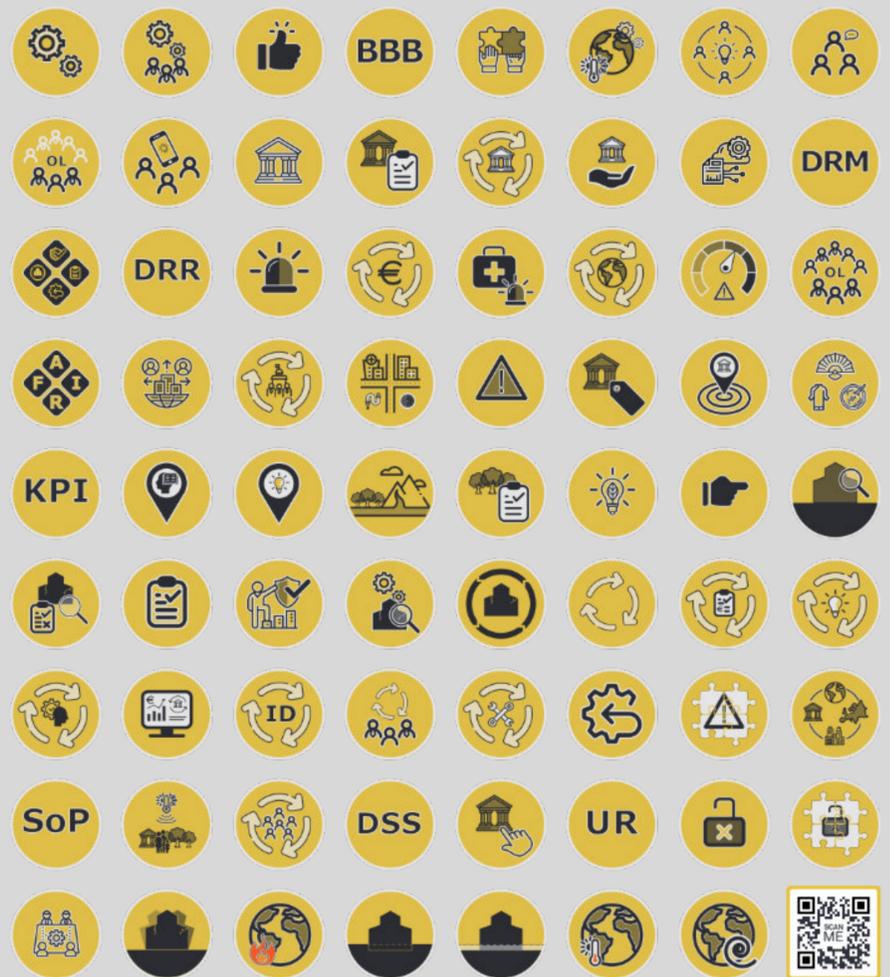

Functionality

The existing knowledge collected in the fields of cultural heritage management, climate change adaptation and disaster risk management represent an observatory aiming at supporting the Open Labs in the implementation of the project activities.
